22.

- (a) Graph showing variation of intensity with θ
 (b) Determination of values of θ and β

1

1+1

(a) The required graph would have the form shown as:

1

Using $I_2 = I_1 \cos^2 \theta$

(b) $I_1 =$ Light transmitted by P_1

$I_3 =$ Light transmitted by $P_3 = I_1 \cos^2 \beta$

$I_2 =$ Light transmitted by $P_2 = I_3 \cos^2(\theta - \beta)$

Alternatively, (Award mark to student who indicates correct value of I_1, I_2 and I_3 by making a diagram)

$$\therefore I_2 = I_3$$

$$I_1 \cos^2 \beta \cdot \cos^2(\theta - \beta) = I_1 \cos^2 \beta$$

$$\theta = \beta$$

 $\frac{1}{2}$ $\frac{1}{2}$

Also $I_1 = I_2$

$$I_1 = I_1 \cos^2 \beta \cdot \cos^2(\theta - \beta)$$

or $\cos^2 \theta = 1$

$$\therefore \theta = 0^\circ \text{ or } \pi$$

Therefore $\beta = 0^\circ \text{ or } \pi$

 $\frac{1}{2}$ $\frac{1}{2}$

3

23.

(a) Difference between a solenoid and a toroid	1
(b) Derivation of the relation $B = \mu_0 n I$	1
(c) Magnetic field (i) inside and (ii) outside	$\frac{1}{2} + \frac{1}{2}$

(a) A toroid can be viewed as a solenoid which has been bent into a circular shape to close on itself

1

(b)

For the magnetic field at a point S inside a toroid we have

$$B(2\pi r) = \mu_0 NI$$

$$B = \mu_0 \frac{NI}{2\pi r} = \mu_0 n I \quad (\text{n = no. of turns per unit length of solenoid})$$

$\frac{1}{2}$

(c) For the loop 1, Ampere's circuital law gives

$$B_1 \cdot 2\pi r_1 = \mu_0 (0) \quad \text{i.e. } B_1 = 0$$

$\frac{1}{2}$

Thus the magnetic field, in the open space inside the toroid is zero.

Also at point Q, we have $B_3(2\pi r_3) = \mu_0 (I_{\text{enclosed}})$

But from the sectional cut, we see that the current coming out of the plane of the paper, is cancelled exactly by the current going into it.

Hence $I_{\text{enclosed}} = 0$

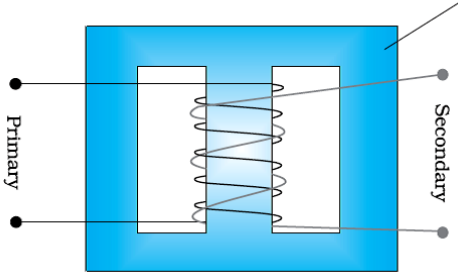

$$\therefore B_3 = 0$$

$\frac{1}{2}$

Derivation of lens maker's formula	2 ½
b) Calculation of radius of curvature	1 ½

½

½

½

The first refracting surface ABC forms the image I_1 of the object O. The image I_1 acts as a virtual object for the second refracting surface ADC which forms the real image I as shown in the diagram

For refraction at ABC

$$\frac{n_2}{v_1} - \frac{n_1}{u} = \frac{n_2 - n_1}{R_1} \text{----- (i)}$$

½

For refraction at ADC

$$\frac{n_2}{v} - \frac{n_1}{u} = \frac{n_1 - n_2}{R_{12}} \text{----- (ii)}$$

½

Adding equation (i) and equation (ii)

$$\frac{n_2}{v} - \frac{n_1}{u} = (n_2 - n_1) \left(\frac{1}{R_1} - \frac{1}{R_2} \right)$$

$$\frac{1}{v} - \frac{1}{u} = \left(\frac{n_2}{n_1} - 1 \right) \left(\frac{1}{R_1} - \frac{1}{R_2} \right)$$

We know If $u = \infty, v = f$

$$\frac{1}{v} - \frac{1}{u} = \frac{1}{f}$$

$$\frac{1}{f} = (n_2 - 1) \left(\frac{1}{R_1} - \frac{1}{R_2} \right)$$

$$(b) \frac{1}{f} = (\mu - 1) \left(\frac{1}{R_1} - \frac{1}{R_2} \right)$$

$$\frac{1}{20} = (1.55 - 1) \left(\frac{1}{R} - \frac{1}{-R} \right)$$

$$= 0.55 \times \frac{2}{R}$$

$$R = 0.55 \times 2 \times 20 = 22 \text{ cm}$$

$\frac{1}{2} + \frac{1}{2}$

(b) The circuit diagram, for the photodiode, is shown here.

$\frac{1}{2}$

The photodiode is illuminated by optical signal, whose photon energy is greater than the energy gap of the semiconductor used. The electric field, at the junction, separates the electrons and holes and thus gives rise to an emf. When an external load is connected, a (photo) current flows through it. The magnitude of this current is proportional to the intensity of light incident on the photodiode.

OR

(a) Circuit diagram	1
Description of current formation	1
Deduction of $I_e = I_b + I_c$	½
(b) Circuit diagram	1
Working	1 ½

a) The circuit diagram is shown here

The emitter-base junction, being forward biased, the majority charge carriers (electrons), from the emitter, flow into the base region constituting the emitter current (I_E)

The base region, being very thin, only a (very) small fraction, of these charge carriers, swamps the holes present in the base region resulting in a (small) base current (I_B).

The majority of these charge carriers, are attracted by the (reverse biased) collector. These make up the collector current (I_C).

It is clear, therefore, that

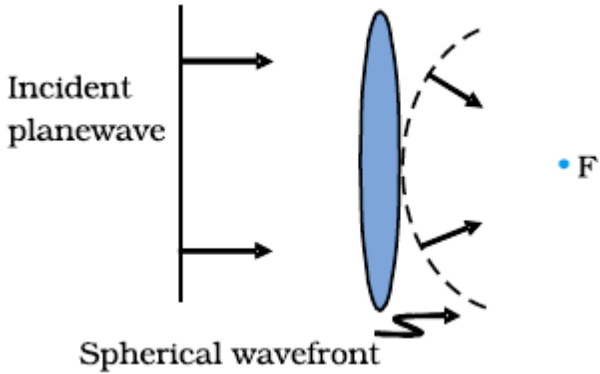

$$I_E = I_C + I_B$$

b) The circuit diagram, of a transistor, working as an amplifier, in its CE mode, is shown here.

If a small sinusoidal voltage is superimposed on the dc base bias by connecting the source of this signal in series with V_{BB} supply. Then the base current will have sinusoidal variations superposed on the values I_B . As a consequence the collector current also will have sinusoidal variation superimposed on the value of I_C producing in turn corresponding change in the output voltage V_o .

- | | |
|--|-----|
| (a) Reason for momentary deflection | 1/2 |
| Deflection after the capacitor gets fully charged | 1/2 |
| (b) Explanation for modification in Ampere's circuital law | 2 |

- (a) The momentary deflection is due to the transient current flowing through the circuit when the capacitor is getting charged. 1/2
 The deflection would be zero when the capacitor gets fully charged. 1/2
- (b) We consider the charging of a capacitor when it is being charged by connecting it to a dc source.

In Ampere's circuital law, namely

$$B (2\pi r) = \mu_0 i$$

We have i as non zero for surface (a) but zero for surface (c)

Hence there is a contradiction in the value of B ; calculated one way we have a magnetic field at P but calculated another way we have $B=0$

To remove this contradiction the concept of displacement current

$$(i_d = \epsilon_0 \frac{d\phi_E}{dt} = i) \text{ was introduced}$$

and Ampere's circuital law was put in its generalized form namely

$$\oint_B \vec{\cdot} \frac{d\vec{l}}{dl} = \mu_0 i_c + \mu_0 \epsilon_0 \frac{d\phi_E}{dt}$$

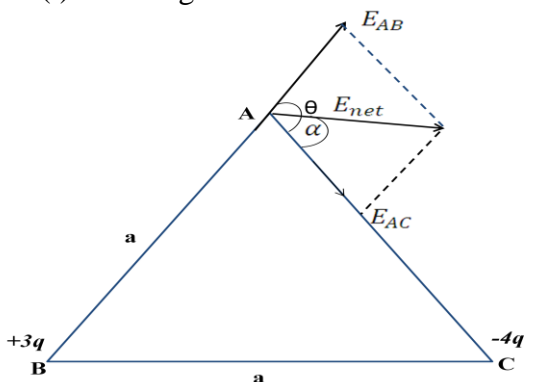

This form gives consistent results for values of B irrespective of which surface is used to calculate it.

(ii) Reverse biasing	1/2														
VI characteristics	1														
Explanation	1/2														
(b) Circuit diagram	1/2														
Explanation	2														

The V-I characteristics ,of a diode, have the form shown here.

1/2+ 1/2

(b) The circuit diagram, for the photodiode, is shown here.

1/2

The photodiode is illuminated by optical signal, whose photon energy is greater than the energy gap of the semiconductor used.

1/2

The electric field, at the junction, separates the electrons and holes and thus gives rise to an emf.

1/2

When an external load is connected, a (photo) current flows through it. The magnitude of this current is proportional to the intensity of light incident on the photodiode.

1/2

5

OR

(a) Circuit diagram	1
Description of current formation	1
Deduction of $I_e = I_b + I_c$	½
(b) Circuit diagram	1
Working	1 ½

a) The circuit diagram is shown here

The emitter-base junction, being forward biased, the majority charge carriers (electrons), from the emitter, flow into the base region constituting the emitter current (I_E)

The base region, being very thin, only a (very) small fraction, of these charge carriers, swamps the holes present in the base region resulting in a (small) base current (I_B).

The majority of these charge carriers, are attracted by the (reverse biased) collector. These make up the collector current (I_C).

It is clear, therefore, that

$$I_E = I_C + I_B$$

b) The circuit diagram, of a transistor, working as an amplifier, in its CE mode, is shown here.

If a small sinusoidal voltage is superimposed on the dc base bias by connecting the source of this signal in series with V_{BB} supply. Then the base current will have sinusoidal variations superposed on the values I_B . As a consequence the collector current also will have sinusoidal variation superimposed on the value of I_C producing in turn corresponding change in the output voltage V_o .

29.

(a) Schematic arrangement	1
(b) Principle of a transformer Obtaining expression	½
(i) $\frac{V_1}{V_2} = \frac{N_1}{N_2}$	1
(ii) $\frac{V_1}{V_2} = \frac{I_2}{I_1}$	1
(c) Assumptions (any one)	½
(d) Two reasons for energy losses	½ + ½

a)

1

b) Principle of a transformer: when alternating current flows through the primary coil, an emf is induced in the neighbouring (secondary) coil

½

(i) Let $\frac{d\phi}{dt}$ be the rate of change of flux through each turn of the primary and the secondary coil

$$\frac{e_1}{e_2} = -N_1 \frac{d\phi}{dt} / -N_2 \frac{d\phi}{dt} = \frac{N_1}{N_2}$$

½

or

$$\frac{V_1}{V_2} = \frac{N_1}{N_2} \text{ -----(1)}$$

½

(ii) But for an ideal transformer $V_1 I_1 = V_2 I_2$

$$\frac{V_1}{V_2} = \frac{I_2}{I_1} \text{ -----(2)}$$

½

From equation (1) and (2)

$$\frac{V_1}{V_2} = \frac{N_1}{N_2} = \frac{I_2}{I_1}$$

½

c) Main assumptions

(i) The primary resistance and current are small

(ii) The flux linked with the primary and secondary coils is same / there is no leakage of flux from the core.

(iii) Secondary current is small

(**Any one**)

½

d) Reason due to which energy losses may occur

Flux leakage/resistance of the coils / eddy currents / Hysteresis (**Any two**)

½ + ½

5

OR

a) Derivation of the expressions for	2 ½
i. Induced emf	
ii. Induced current	
b) Expression for magnitude of force and its direction	1½
c) Expression for power	1

a) In one revolution

Change of area, $dA = \pi \ell^2$

\therefore change of magnetic flux

$$d\phi = \vec{B} \cdot d\vec{A} = B dA \cos 0^\circ$$

$$= B \pi \ell^2$$

Period of revolution T

$$(i) \text{ Induced emf } \varepsilon = B \pi \ell^2 / T = B \pi \ell^2 v$$

$$(ii) \text{ Induced current in the rod, } I = \frac{\varepsilon}{R} = \frac{\pi v B \ell^2}{R}$$

[Note: Award 2 marks if the student derives the above relation using other method.]

b) Force acting on the rod, $F = I \ell B$

$$= \frac{\pi v B^2 \ell^3}{R}$$

The external force required to rotate the rod opposes the Lorentz force acting on the rod / external force acts in the direction opposite to the Lorentz force

c) Power required to rotate the rod

$$P = F \cdot v$$

$$= \frac{\pi v B^2 \ell^3 v}{R}$$

½

1/2

The first refracting surface ABC forms the image I_1 of the object O. The image I_1 acts as a virtual object for the second refracting surface ADC which forms the real image I as shown in the diagram

For refraction at ABC

$$\frac{n_2}{v_1} - \frac{n_1}{u} = \frac{n_2 - n_1}{R_1} \text{ ----- (i)}$$

1/2

For refraction at ADC

$$\frac{n_2}{v} - \frac{n_1}{u} = \frac{n_1 - n_2}{R_{12}} \text{ ----- (ii)}$$

1/2

Adding equation (i) and equation (ii)

$$\frac{n_1}{v} - \frac{n_1}{u} = (n_2 - n_1) \left(\frac{1}{R_1} - \frac{1}{R_2} \right)$$

$$\frac{1}{v} - \frac{1}{u} = \left(\frac{n_2}{n_1} - 1 \right) \left(\frac{1}{R_1} - \frac{1}{R_2} \right)$$

1/2

We know If $u = \infty, v = f$

$$\frac{1}{v} - \frac{1}{u} = \frac{1}{f}$$

$$\frac{1}{f} = (n_2 - 1) \left(\frac{1}{R_1} - \frac{1}{R_2} \right)$$

1/2

$$(b) \frac{1}{f} = (\mu - 1) \left(\frac{1}{R_1} - \frac{1}{R_2} \right)$$

$$\frac{1}{20} = (1.55 - 1) \left(\frac{1}{R} - \frac{1}{-R} \right)$$

$$= 0.55 \times \frac{2}{R}$$

$$R = 0.55 \times 2 \times 20 = 22 \text{ cm}$$

OR

(a) Labelled ray diagram	1 ½
Derivation of expression for magnifying power	1 ½
(b) Determination of total magnification	2

a)

[Note : deduct ½ mark if not labelled]

Derivation

Magnifying Power

$$M = \frac{\tan \beta}{\tan \alpha} \cong \frac{\beta}{\alpha}$$

Final image is formed at infinity when the image $A'B'$ is formed by the objective lens at the focal point of the eye piece

$$m = \frac{h}{f_e} \times \frac{f_o}{h}$$

$$= \frac{f_o}{f_e}$$

b) Given

$$f_o + f_e = 105, f_o = 20 f_e$$

$$20 f_e + f_e = 105$$

$$f_e = \frac{105}{21} = 5 \text{ cm}$$

$$f_o = 20 \times 5 = 100 \text{ cm}$$

$$\therefore \text{Magnification } m = \frac{f_o}{f_e} = \frac{100}{5} = 20$$

(a) Difference between a solenoid and a toroid	1								
(b) Derivation of the relation $B = \mu_0 n I$	1								
(c) Magnetic field (i) inside and (ii) outside	$\frac{1}{2} + \frac{1}{2}$								

(b)

For the magnetic field at a point S inside a toroid we have

$$B(2\pi r) = \mu_0 NI$$

$$B = \mu_0 \frac{NI}{2\pi r} = \mu_0 nI \quad (\text{n = no. of turns per unit length of solenoid})$$

(c) For the loop 1, Ampere's circuital law gives

$$B_1 \cdot 2\pi r_1 = \mu_0(0) \quad \text{i.e. } B_1 = 0$$

Thus the magnetic field, in the open space inside the toroid is zero.

Also at point Q, we have $B_3(2\pi r_3) = \mu_0(I_{\text{enclosed}})$

But from the sectional cut, we see that the current coming out of the plane of the paper, is cancelled exactly by the current going into it.

Hence $I_{\text{enclosed}} = 0$

$$\therefore B_3 = 0$$

1/2

The first refracting surface ABC forms the image I_1 of the object O. The image I_1 acts as a virtual object for the second refracting surface ADC which forms the real image I as shown in the diagram

For refraction at ABC

$$\frac{n_2}{v_1} - \frac{n_1}{u} = \frac{n_2 - n_1}{R_1} \text{----- (i)}$$

1/2

For refraction at ADC

$$\frac{n_2}{v} - \frac{n_1}{u} = \frac{n_1 - n_2}{R_{12}} \text{----- (ii)}$$

1/2

Adding equation (i) and equation (ii)

$$\frac{n_1}{v} - \frac{n_1}{u} = (n_2 - n_1) \left(\frac{1}{R_1} - \frac{1}{R_2} \right)$$

$$\frac{1}{v} - \frac{1}{u} = \left(\frac{n_2}{n_1} - 1 \right) \left(\frac{1}{R_1} - \frac{1}{R_2} \right)$$

1/2

We know If $u = \infty, v = f$

$$\frac{1}{v} - \frac{1}{u} = \frac{1}{f}$$

$$\frac{1}{f} = (n_2 - 1) \left(\frac{1}{R_1} - \frac{1}{R_2} \right)$$

1/2

$$(b) \frac{1}{f} = (\mu - 1) \left(\frac{1}{R_1} - \frac{1}{R_2} \right)$$

$$\frac{1}{20} = (1.55 - 1) \left(\frac{1}{R} - \frac{1}{-R} \right)$$

$$= 0.55 \times \frac{2}{R}$$

$$R = 0.55 \times 2 \times 20 = 22 \text{ cm}$$

OR

(a) Labelled ray diagram	1 ½
Derivation of expression for magnifying power	1 ½
(b) Determination of total magnification	2

a)

[Note : deduct ½ mark if not labelled]

Derivation

Magnifying Power

$$M = \frac{\tan \beta}{\tan \alpha} \cong \frac{\beta}{\alpha}$$

Final image is formed at infinity when the image $A'B'$ is formed by the objective lens at the focal point of the eye piece

$$m = \frac{h}{f_e} \times \frac{f_o}{h} = \frac{f_o}{f_e}$$

b) Given

$$f_o + f_e = 105, f_o = 20 f_e$$

$$20 f_e + f_e = 105$$

$$f_e = \frac{105}{21} = 5 \text{ cm}$$

$$f_o = 20 \times 5 = 100 \text{ cm}$$

$$\therefore \text{Magnification } m = \frac{f_o}{f_e} = \frac{100}{5} = 20$$

(a) Circuit arrangement of p-n junction in	
(i) Forward biasing	½
(ii) Reverse biasing	½
VI characteristics	1
Explanation	½
(b) Circuit diagram	½
Explanation	2

(a)

Forward biasing

Reverse biasing

The VI characteristics are obtained by connecting the battery, to the diode, through a potentiometer (or rheostat). The applied voltage to the diode is changed. The values of current, for different values of voltage, are noted and a graph between V and I is plotted.

The V-I characteristics, of a diode, have the form shown here.

(b) The circuit diagram, for the photodiode, is shown here.

1/2

1/2

1

1/2+ 1/2

The photodiode is illuminated by optical signal, whose photon energy is greater than the energy gap of the semiconductor used. The electric field, at the junction, separates the electrons and holes and thus gives rise to an emf. When an external load is connected, a (photo) current flows through it. The magnitude of this current is proportional to the intensity of light incident on the photodiode.

OR

(a) Circuit diagram	1
Description of current formation	1
Deduction of $I_e = I_b + I_c$	1/2
(b) Circuit diagram	1
Working	1 1/2

a) The circuit diagram is shown here

The emitter-base junction, being forward biased, the majority charge carriers (electrons), from the emitter, flow into the base region constituting the emitter current (I_E)

The base region, being very thin, only a (very) small fraction, of these charge carriers, swamps the holes present in the base region resulting in a (small) base current (I_B).

The majority of these charge carriers, are attracted by the (reverse biased) collector. These make up the collector current (I_C).

It is clear, therefore, that

$$I_E = I_C + I_B$$

- b) The circuit diagram, of a transistor, working as an amplifier, in its CE mode, is shown here.

If a small sinusoidal voltage is superimposed on the dc base bias by connecting the source of this signal in series with V_{BB} supply. Then the base current will have sinusoidal variations superposed on the values I_B . As a consequence the collector current also will have sinusoidal variation superimposed on the value of I_C producing in turn corresponding change in the output voltage V_o .
