The oleum obtained is diluted to give sulphuric acid $2\text{SO}_2(\text{g}) + \text{O}_2(\text{g}) \xrightarrow{\text{V}_2\text{O}_5} 2\text{SO}_3(\text{g})$ Reaction condition – pressure of 2 bar and temperature of 720 K Catalyst used is V_2O_5 Yield – 96 – 98% pure	1 1 1 1 1 1
26	a)i) Molar conductivity of a solution at a given concentration is the conductance of the volume V of solution containing one mole of electrolyte kept between two electrodes with area of cross section A and distance of unit length. ii) Secondary battery- can be recharged by passing current through it in opposite direction so that it can be used again. iii) Galvanic cells that are designed to convert the energy of combustion of fuels like hydrogen, methane, methanol, etc. directly into electrical energy are called fuel cells. b)i) The amount of chemical reaction which occurs at any electrode during electrolysis by a current is proportional to the quantity of electricity passed through the electrolyte (solution or melt). ii) Limiting molar conductivity of an electrolyte can be represented as the sum of the individual contributions of the anion and cation of the electrolyte.
