22.

Ray diagram	1
Nature of final image	½
Position of final image	1 ½

For the convex lens

$$u = -60 \text{ cm}, f = +20 \text{ cm}$$

$$\frac{1}{v} - \frac{1}{u} = \frac{1}{f} \text{ gives } v = +30 \text{ cm}$$

For the convex mirror

$$u = +(30 - 15) \text{ cm} = 15 \text{ cm}, f = +\frac{20}{2} \text{ cm} = 10 \text{ cm}$$

$$\frac{1}{v} + \frac{1}{u} = \frac{1}{f} \text{ gives } v = +30 \text{ cm}$$

Final image is formed at the distance of 30 cm from the convex mirror (or 45 cm from the convex lens) to the right of the convex mirror.

The final image formed is a virtual image.

23.

Deriving the expression for average power	2
Condition for no power dissipation	½
Condition for maximum power dissipation	½

Applied voltage = $V_0 \sin \omega t$

Current in the circuit = $I_0 \sin (\omega t - \phi)$

where ϕ is the phase lag of the current with respect to the voltage applied ,

Hence instantaneous power dissipation

$$= V_0 \sin \omega t \times I_0 \sin (\omega t - \phi)$$

$$= \frac{V_0 I_0}{2} [2 \sin \omega t \cdot \sin (\omega t - \phi)]$$

$$= \frac{V_0 I_0}{2} [\cos \phi - \cos(2\omega t - \phi)]$$

Therefore, average power for one complete cycle

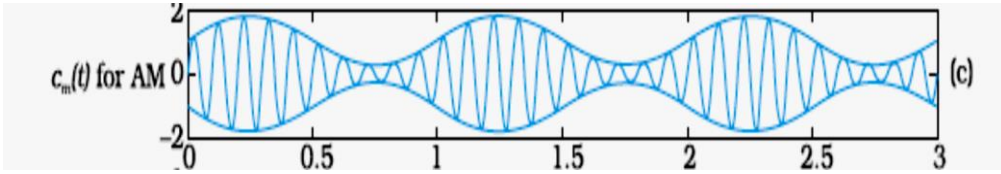

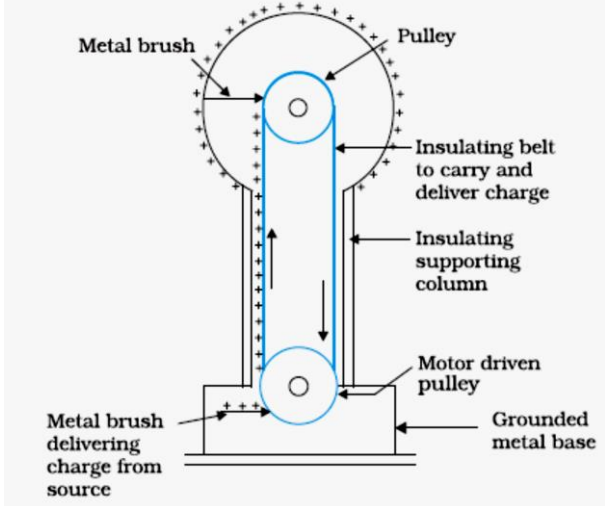

$$= \text{average of } \left[\frac{V_0 I_0}{2} [\cos \phi - \cos(2\omega t - \phi)] \right]$$

The average of the second term over a complete cycle is zero .

Hence , average power dissipated over one complete cycle = $\frac{V_0 I_0}{2} \cos \phi$

[Note : Please also accept alternative correct approach.]

	<p>Conditions</p> <p>(i) No power is dissipated when $R = 0$ (or $\phi = 90^\circ$) [Note: Also accepts if the student writes ‘This condition cannot be satisfied for a series LCR circuit’.]</p> <p>(ii) Maximum power is dissipated when $X_L = X_C$ or $\omega L = \frac{1}{\omega C}$ (or $\phi = 0$)</p>	<p>$\frac{1}{2}$</p> <p>$\frac{1}{2}$</p>	<p>3</p>

Principle & working

Consider a set up of the type shown here

- i. Potential inside and on the surface, of the conducting sphere of radius 'R':

$$V'_R = \frac{1}{4\pi\epsilon_0} \cdot \frac{Q}{R}$$

- ii. Potential due to small sphere of radius 'r' carrying a charge 'q':

At the surface of the smaller sphere : $V'_r = \frac{1}{4\pi\epsilon_0} \cdot \frac{q}{r}$

At the surface of the larger sphere : $V''_R = \frac{1}{4\pi\epsilon_0} \cdot \frac{Q}{R}$

∴ The difference of potential between the smaller and the larger sphere:

$$\begin{aligned} \Delta V &= \frac{1}{4\pi\epsilon_0} \cdot \left[\left(\frac{Q}{R} + \frac{q}{r} \right) - \left(\frac{Q}{R} + \frac{q}{r} \right) \right] \\ &= \frac{q}{4\pi\epsilon_0} \left(\frac{1}{r} - \frac{1}{R} \right) \end{aligned}$$

When 'q' is positive, the inner sphere would always be at a higher potential with respect to outer sphere, irrespective of the amount of charges on the two.

∴ When both the spheres are connected, charge will flow from the smaller sphere to the larger sphere. Thus for a set up of the type shown, charge would keep on piling up on the larger sphere.

Use : This machine is used to accelerate charged particles (electron, protons, ions) to high energies.

Limitation: It can build up potentials upto a few million volts only.

OR

(a)	Deducing the expression for torque	2
(b)	Finding the ratio of the flux through the two spheres	2
(c)	Finding the change in flux	1

(a)

The forces, acting on the two charges of the dipole, are

$$+q\vec{E} \text{ and } -q\vec{E}$$

1/2

1/2

1/2

1/2

1/2

1/2

5

1/2

1/2

The net force on the dipole is zero.

The two forces are, however, equivalent to a torque having a magnitude

$$\begin{aligned} \tau &= (qE)AC \\ &= qE \cdot 2a \sin \theta \\ &= pE \sin \theta \end{aligned}$$

1/2

The direction of this torque is that of the cross product $(\vec{p} \times \vec{E})$. Hence, the torque acting on the dipole, is given by

$$\vec{\tau} = \vec{p} \times \vec{E}$$

1/2

(b)

As per Gauss's Theorem

$$\text{Electric Flux} = \oint_S \vec{E} \cdot d\vec{S} = \frac{q_{\text{enclosed}}}{\epsilon_0}$$

1/2

$$\therefore \text{For sphere } S_1, \text{ flux enclosed} = \phi_1 = \frac{2Q}{\epsilon_0}$$

1/2

1/2

$$\text{For sphere } S_2, \text{ flux enclosed} = \phi_2 = \frac{2Q+4Q}{\epsilon_0} = \frac{6Q}{\epsilon_0}$$

1/2

$$\therefore \frac{\phi_1}{\phi_2} = \frac{1}{3}$$

1

When a medium of dielectric constant ϵ_r is introduced in sphere S_1 the flux through S_1 would be $\phi'_1 = \frac{2Q}{\epsilon_r}$

[Also award this mark if the student writes $\phi_1 = \frac{2Q}{\epsilon_0 \epsilon_r}$]

[**Note** : If the student just writes that the flux through S_1 decreases, award 1/2 mark only.]

5

29.

(a) Formation of bright and dark fringes	1
Obtaining the expression for fringe width	3
(b) Finding the ratio	1

(a) The light rays from the two (coherent) slits, reaching a point 'P' on the screen, have a path difference ($S_2P - S_1P$). The point 'P' would, therefore be a

- i. Point of maxima (bright fringe), if $S_2P - S_1P = n\lambda$.
- ii. Point of minima (dark fringe), if $S_2P - S_1P = (2n+1)\frac{\lambda}{2}$

(b)

We have

$$(S_2P)^2 - (S_1P)^2 = \left\{ D^2 - \left(x + \frac{d}{2} \right)^2 \right\} - \left\{ D^2 + \left(x - \frac{d}{2} \right)^2 \right\}$$

$$= 2xd$$

$$S_2P - S_1P = \frac{2xd}{S_2P + S_1P} \approx \frac{2xd}{2D} = \frac{xd}{D}$$

∴ We have maxima at points, where

$$\frac{xd}{D} = n\lambda$$

and minima at points where

$$\frac{xd}{D} = \left(\frac{2n+1}{2} \right) \lambda$$

Now, fringe width β = separation between two successive maxima (or two successive minima) = $x_n - x_{n-1}$

$$\therefore \beta = \frac{\lambda D}{d}$$

(b) We have

$$\frac{I_{max}}{I_{min}} = \frac{(a_1 + a_2)^2}{(a_1 - a_2)^2} = \frac{25}{9}$$

$$\therefore \frac{a_1}{a_2} = \frac{4}{1}$$

$$\therefore \frac{W_1}{W_2} = \frac{I_1}{I_2} = \frac{(a_1)^2}{(a_2)^2} = \frac{16}{1}$$

[Note: Give ½ mark if the student just writes Intensity \propto width

OR

a) Obtaining the diffraction pattern	1 ½
Conditions for angular width	1 ½
b) Calculation of separation	2

The path difference (NP-LP) , between the two edges of the slit, is given by

$$NP-LP \cong NQ = a \sin\theta \approx a\theta$$

We, therefore, get maxima and minima, at different points of the screen, depending on the path difference between the contributions from the wavelets, emanating from different points of the slit. This results in a diffraction pattern on the screen.

The path difference between two points M_1 , M_2 , in the slit plane, separated by a distance 'y', is $y\theta$.

At the central point, 'C', on the screen, ' θ ' is zero.

All parts of the slit contribute in phase

Hence 'C' is a maximum.

At all points where ' $\theta \cong (n + \frac{1}{2}) \frac{\lambda}{a}$ ', we get (secondary) maxima of varying intensity. This is because of the non-zero contribution of a (decreasing) part of the slit at these points.

At all points where $\theta \approx \frac{n\lambda}{a}$, we get minima.

This is because of a net (almost) zero contribution of the whole slit at these points.

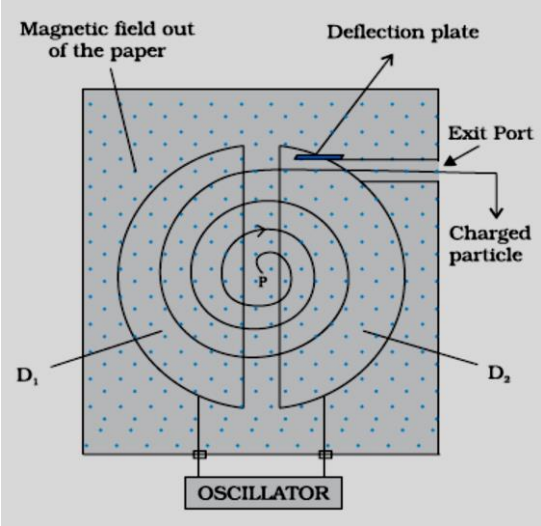

[**Note** : Please also accept alternative correct diagram with appropriate explanation.]

(b) Angular width of the secondary maxima $\approx 2(2n+ 1) \frac{\lambda}{a}$

∴ Linear width = $[(2n+ 1) \frac{\lambda}{a}] D$

∴ Linear separation, between the first maxima (n=1) of the two wavelengths, on the screen, is

$$\frac{3(\lambda_2 - \lambda_1)}{a} \times D$$

	$\therefore \text{Seperation} = \frac{3(596-590) \times 10^{-9}}{2 \times 10^{-6}} \times 1.5m$ $= 13.5 \times 10^{-3}m (= 13.5 \text{ mm})$	1	5

they cross the space between the two dees. The radius of their path increases with increase in energy and they are finally made to leave the system via an exit slit.

OR

(a) Labelled diagram	1
Principle and working	2
(b) i) Reason for cylindrical soft iron core	1
ii) Comparison of current sensitivity and voltage sensitivity	1

Principle and working : A current carrying coil, placed in a uniform magnetic field, (can) experience a torque

Consider a rectangular coil for which no. of turns = N,

Area of cross- section = $l \times b = A$,

Intensity of the uniform magnetic field = B,

Current through the coil = I

\therefore Deflecting torque = $BIL \times b = BIA$

For N turns $\tau = NBIA$

Restoring torque in the spring = $k\theta$

(k = restoring torque per unit twist)

$$\therefore NBIA = k\theta$$

$$\therefore I = \left(\frac{k}{NBA} \right) \theta$$

$$\therefore I \propto \theta$$

The deflection of the coil, is, therefore, proportional to the current flowing through it.

(b) (i) The soft iron core not only makes the field radial but also increases the strength of the magnetic field.

[**Note**:- Award this one mark even if the student writes just one of the two reasons given above)

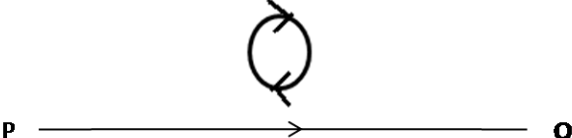

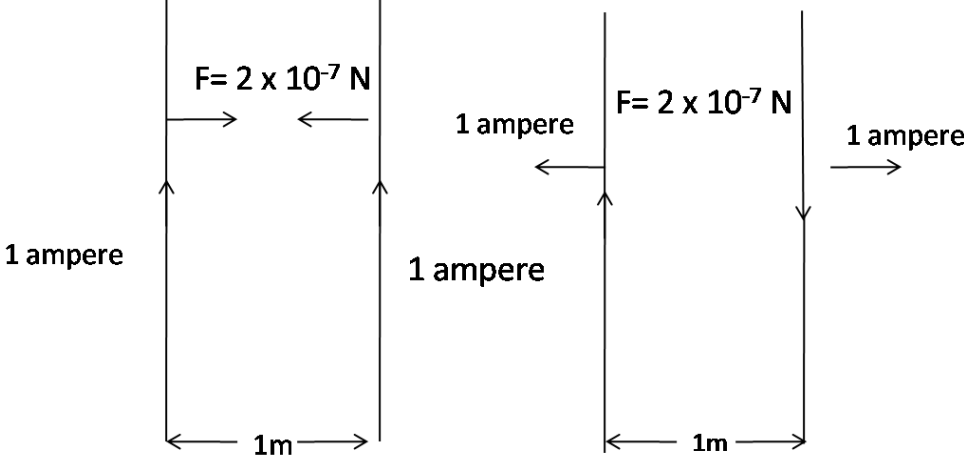

(ii) We have

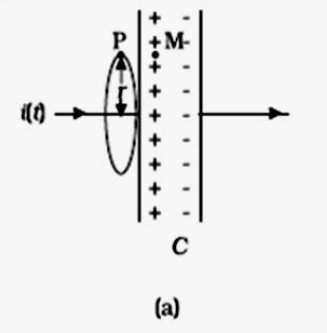

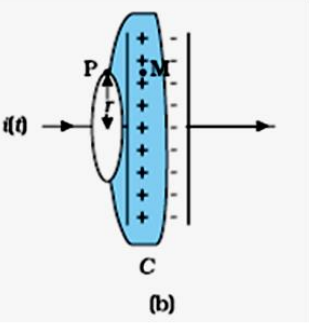

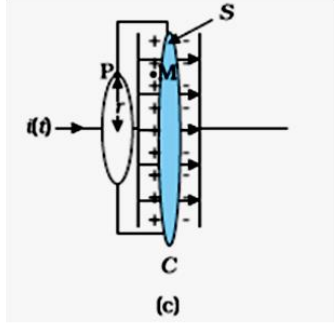

$$\text{Current sensitivity} = \frac{\theta}{I} = NBA/k$$

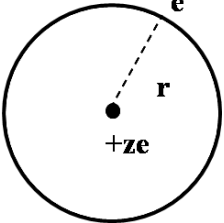

$$\text{Voltage sensitivity} = \frac{\theta}{V} = \frac{\theta}{IR} = \left(\frac{NBA}{k} \right) \cdot \frac{1}{R}$$

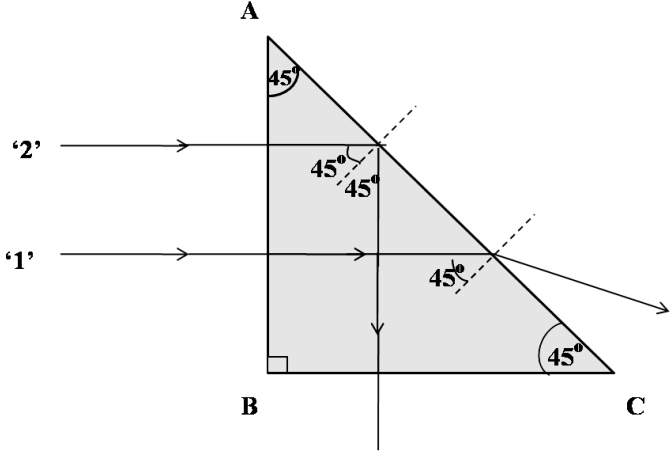

It follows that an increase in current sensitivity may not necessarily increase the voltage sensitivity.

Working	1												

∴ Centripetal force $\frac{mv^2}{r} = 2 v B_{\perp}$

∴ $r = \frac{mv}{qB_{\perp}}$

∴ frequency = $\frac{v}{2\pi r} = \frac{qB_{\perp}}{2\pi m}$

∴ It is independent of the velocity or the energy of the particle.

1/2

1/2

1/2

1

Construction: The cyclotron is made up of two hollow semi-circular disc like metal containers, D_1 and D_2 , called dees. It uses crossed electric and magnetic fields. The electric field is provided by an oscillator of adjustable frequency.

[**Note:** Award this mark even if the student labels the diagram properly without writing the details of the construction.]

1

Working: In a cyclotron, the frequency of the applied alternating field is adjusted to be equal to the frequency of revolution of the charged particles in the magnetic field. This ensures that the particles get accelerated every time they cross the space between the two dees. The radius of their path increases with increase in energy and they are finally made to leave the system via an exit slit.

OR

(a) Labelled diagram	1
Principle and working	2
(b) i) Reason for cylindrical soft iron core	1
ii) Comparison of current sensitivity and voltage sensitivity	1

Principle and working : A current carrying coil, placed in a uniform magnetic field, (can) experience a torque

Consider a rectangular coil for which no. of turns = N,

Area of cross- section = $l \times b = A$,

Intensity of the uniform magnetic field = B,

Current through the coil = I

$$\therefore \text{Deflecting torque} = BIL \times b = BIA$$

$$\text{For } N \text{ turns } \tau = NBA$$

$$\text{Restoring torque in the spring} = k\theta$$

(k=restoring torque per unit twist)

$$\therefore NBA = k\theta$$

$$\therefore I = \left(\frac{k}{NBA} \right) \theta$$

$$\therefore I \propto \theta$$

The deflection of the coil, is, therefore, proportional to the current flowing through it.

(b) (i) The soft iron core not only makes the field radial but also increases the strength of the magnetic field.

[**Note**:- Award this one mark even if the student writes just one of the two reasons given above)

(ii) We have

$$\text{Current sensitivity} = \frac{\theta}{I} = NBA/k$$

$$\text{Voltage sensitivity} = \frac{\theta}{V} = \frac{\theta}{IR} = \left(\frac{NBA}{k} \right) \cdot \frac{1}{R}$$

It follows that an increase in current sensitivity may not necessarily increase the voltage sensitivity.

Diagram	2
Principle and working	2
Use and limitation	1/2 + 1/2

[Note : Award 1 mark only if the diagram is not labelled]

Principle & working

Consider a set up of the type shown here

- i. Potential inside and on the surface, of the conducting sphere of radius 'R':

$$V_R' = \frac{1}{4\pi\epsilon_0} \cdot \frac{Q}{R}$$

- ii. Potential due to small sphere of radius 'r' carrying a charge 'q':

At the surface of the smaller sphere : $V_r' = \frac{1}{4\pi\epsilon_0} \cdot \frac{q}{r}$

At the surface of the larger sphere : $V_R'' = \frac{1}{4\pi\epsilon_0} \cdot \frac{Q}{R}$

∴ The difference of potential between the smaller and the larger sphere:

$$=\Delta V = \frac{1}{4\pi\epsilon_0} \cdot \left[\left(\frac{Q}{R} + \frac{q}{r} \right) - \left(\frac{Q}{R} + \frac{q}{r} \right) \right]$$

2

1/2

1/2

$$= \frac{q}{4\pi\epsilon_0} \left(\frac{1}{r} - \frac{1}{R} \right)$$

When 'q' is positive, the inner sphere would always be at a higher potential with respect to outer sphere, irrespective of the amount of charges on the two.

∴ When both the spheres are connected, charge will flow from the smaller sphere to the larger sphere. Thus for a set up of the type shown, charge would keep on piling up on the larger sphere.

Use : This machine is used to accelerate charged particles (electron, protons, ions) to high energies.

Limitation: It can build up potentials upto a few million volts only.

OR

- | | | |
|-----|-------------------------------------------------------|---|
| (a) | Deducing the expression for torque | 2 |
| (b) | Finding the ratio of the flux through the two spheres | 2 |
| (c) | Finding the change in flux | 1 |

(a)

The forces, acting on the two charges of the dipole, are $+q\vec{E}$ and $-q\vec{E}$

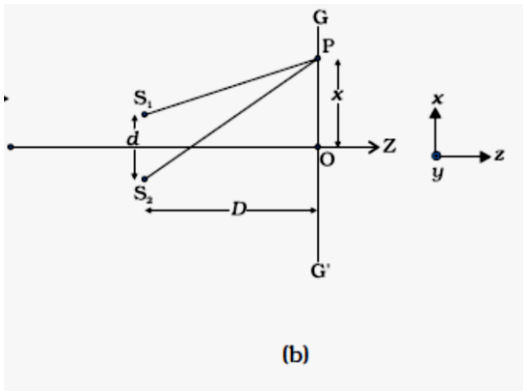

The net force on the dipole is zero.

The two forces are, however, equivalent to a torque having a magnitude

$$\begin{aligned} \tau &= (qE)AC \\ &= qE \cdot 2a \sin \theta \\ &= pE \sin \theta \end{aligned}$$

The direction of this torque is that of the cross product $(\vec{p} \times \vec{E})$. Hence,

	<p>the torque acting on the dipole, is given by</p> $\vec{\tau} = \vec{p} \times \vec{E}$ <p>(b) As per Gauss's Theorem Electric Flux = $\oint_S \vec{E} \cdot \vec{dS} = \frac{q_{\text{enclosed}}}{\epsilon_0}$</p> <p>∴ For sphere S₁, flux enclosed = $\phi_1 = \frac{2Q}{\epsilon_0}$</p> <p>For sphere S₂, flux enclosed = $\phi_2 = \frac{2Q+4Q}{\epsilon_0} = \frac{6Q}{\epsilon_0}$</p> <p>∴ $\frac{\phi_1}{\phi_2} = \frac{1}{3}$</p> <p>When a medium of dielectric consistent ϵ_r is introduced in sphere S₁ the flux through S₁ would be $\phi'_1 = \frac{2Q}{\epsilon_r}$</p> <p>[Also award this mark if the student writes $\phi_1 = \frac{2Q}{\epsilon_0 \epsilon_r}$]</p> <p>[Note : If the student just writes that the flux through S₁ decreases, award ½ mark only.]</p>	<p>½</p> <p>½</p> <p>½</p> <p>½</p> <p>1</p>	<p>5</p>

Point of minima (dark fringe), if S₂P – S₁P = (2n+1) $\frac{\lambda}{2}$ <div style="text-align: center;">  <p>(b)</p> </div> <p>We have</p> $(S_2P)^2 - (S_1P)^2 = \left\{ D^2 - \left(x + \frac{d}{2} \right)^2 \right\} - \left\{ D^2 + \left(x - \frac{d}{2} \right)^2 \right\}$ $= 2xd$ $S_2P - S_1P = \frac{2xd}{S_2P + S_1P} \approx \frac{2xd}{2D} = \frac{xd}{D}$ <p>∴ We have maxima at points, where</p>	(a) Formation of bright and dark fringes	1	Obtaining the expression for fringe width	3	(b) Finding the ratio	1	<p>½</p> <p>½</p> <p>½</p> <p>½</p>	
(a) Formation of bright and dark fringes	1								
Obtaining the expression for fringe width	3								
(b) Finding the ratio	1								

$$\frac{xd}{D} = n\lambda$$

and minima at points where

$$\frac{xd}{D} = \left(\frac{2n+1}{2}\right)\lambda$$

Now, fringe width β = separation between two successive maxima (or two successive minima) = $x_n - x_{n-1}$

$$\therefore \beta = \frac{\lambda D}{d}$$

(b) We have

$$\frac{I_{max}}{I_{min}} = \frac{(a_1 + a_2)^2}{(a_1 - a_2)^2} = \frac{25}{9}$$

$$\therefore \frac{a_1}{a_2} = \frac{4}{1}$$

$$\therefore \frac{W_1}{W_2} = \frac{I_1}{I_2} = \frac{(a_1)^2}{(a_2)^2} = \frac{16}{1}$$

[Note: Give ½ mark if the student just writes Intensity \propto width

OR

a) Obtaining the diffraction pattern	1 ½
Conditions for angular width	1 ½
b) Calculation of separation	2

(a)

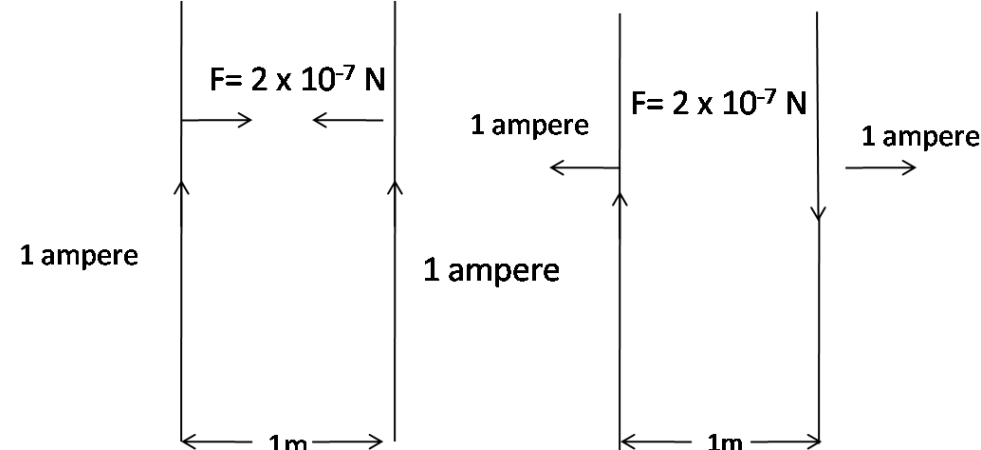

The path difference (NP-LP) , between the two edges of the slit, is given by

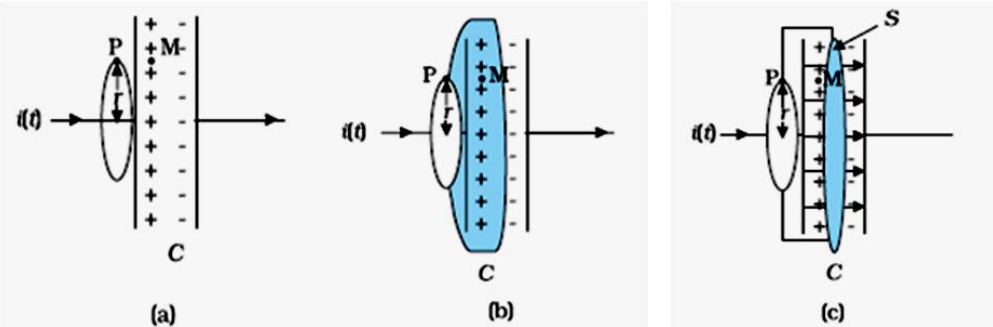

$$NP-LP \cong NQ = a \sin\theta \approx a\theta$$

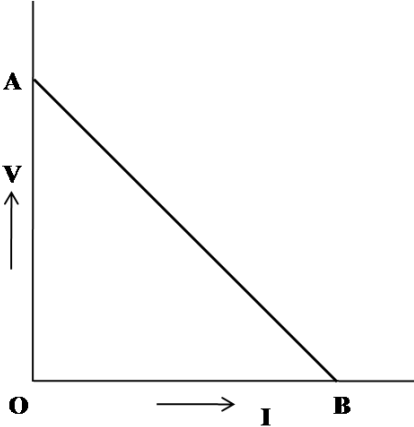

We, therefore, get maxima and minima, at different points of the screen, depending on the path difference between the contributions from the wavelets, emanating from different points of the slit. This results in a

	<p>diffraction pattern on the screen. The path difference between two points M_1, M_2, in the slit plane, separated by a distance 'y', is $y\theta$. At the central point, 'C', on the screen, 'θ' is zero. All parts of the slit contribute in phase Hence 'C' is a maximum.</p> <p>At all points where 'θ' $\cong (n + \frac{1}{2})\frac{\lambda}{a}$, we get (secondary) maxima of varying intensity. This is because of the non-zero contribution of a (decreasing) part of the slit at these points.</p> <p>At all points where $\theta \approx \frac{n\lambda}{a}$, we get minima. This is because of a net (almost) zero contribution of the whole slit at these points.</p> <p>[Note : Please also accept alternative correct diagram with appropriate explanation.]</p> <p>(b) Angular width of the secondary maxima $\approx 2(2n+1)\frac{\lambda}{a}$</p> <p>∴ Linear width = $[(2n+1)\frac{\lambda}{a}] D$</p> <p>∴ Linear separation, between the first maxima (n=1) of the two wavelengths, on the screen, is</p> $\frac{3(\lambda_2 - \lambda_1)}{a} \times D$ <p>∴ Separation = $\frac{3(596-590) \times 10^{-9}}{2 \times 10^{-6}} \times 1.5m$</p> <p>= $13.5 \times 10^{-3}m$ (= 13.5 mm)</p>	<p>$\frac{1}{2}$</p> <p>$\frac{1}{2}$</p> <p>$\frac{1}{2}$</p> <p>$\frac{1}{2}$</p> <p>$\frac{1}{2}$</p> <p>1</p>	<p></p> <p></p> <p></p> <p></p> <p></p> <p>5</p>

Position of the final image (formed by the lens-mirror combination)	2
Ray diagram	1

For the lens:

$$\frac{1}{f} = \frac{1}{v} - \frac{1}{u}$$

U = - 40 cm, f = +20 cm This gives v = + 40cm

This image acts as a (virtual) object for the convex mirror

$$\therefore u = (+40 - 15)cm = 25cm$$

$$\text{Also } f = + \frac{20}{2}cm = +10 cm$$

From

$$\frac{1}{f} = \frac{1}{v} + \frac{1}{u}$$

We get

$$v = \frac{50}{3} cm \approx 16.67cm$$

The final image is, therefore formed at a distance of 16.67 cm ($\frac{50}{3} cm$) to the right of the convex mirror.

(at a distance of 31.67 cm ($=\frac{95}{3} cm$) to the right of the convex lens.

Energy band diagrams	1 ½
Two distinguishing features	1 ½

Two distinguishing features:

- (i) In conductors, the valency band and conduction band tend to overlap (or nearly overlap) while in insulators they are separated by a large energy gap and in semiconductors are separated by a small energy gap.
- (ii) The conduction band, of a conductor, has a large number of electrons available for electrical conduction. However the conduction band of insulators is almost empty while that of the semi-conductor has only a (very) small number of such electrons available for electrical conduction.

28.	<table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="padding: 5px;">(a) Formation of bright and dark fringes</td> <td style="text-align: right; padding: 5px;">1</td> </tr> <tr> <td style="padding: 5px;">Obtaining the expression for fringe width</td> <td style="text-align: right; padding: 5px;">3</td> </tr> <tr> <td style="padding: 5px;">(b) Finding the ratio</td> <td style="text-align: right; padding: 5px;">1</td> </tr> </table> <p>(a) The light rays from the two (coherent) slits, reaching a point ‘P’ on the screen, have a path difference ($S_2P - S_1P$). The point ‘P’ would, therefore be a</p>	(a) Formation of bright and dark fringes	1	Obtaining the expression for fringe width	3	(b) Finding the ratio	1		
(a) Formation of bright and dark fringes	1								
Obtaining the expression for fringe width	3								
(b) Finding the ratio	1								

- i. Point of maxima (bright fringe), if $S_2P - S_1P = n\lambda$.
- ii. Point of minima (dark fringe), if $S_2P - S_1P = (2n+1)\frac{\lambda}{2}$

We have

$$(S_2P)^2 - (S_1P)^2 = \left\{ D^2 + \left(x + \frac{d}{2} \right)^2 \right\} - \left\{ D^2 + \left(x - \frac{d}{2} \right)^2 \right\}$$

$$= 2xd$$

$$S_2P - S_1P = \frac{2xd}{S_2P + S_1P} \approx \frac{2xd}{2D} = \frac{xd}{D}$$

∴ We have maxima at points, where

$$\frac{xd}{D} = n\lambda$$

and minima at points where

$$\frac{xd}{D} = \left(\frac{2n+1}{2} \right) \lambda$$

Now, fringe width β = separation between two successive maxima (or two successive minima) = $x_n - x_{n-1}$

$$\therefore \beta = \frac{\lambda D}{d}$$

(b) We have

$$\frac{I_{max}}{I_{min}} = \frac{(a_1 + a_2)^2}{(a_1 - a_2)^2} = \frac{25}{9}$$

$$\therefore \frac{a_1}{a_2} = \frac{4}{1}$$

$$\therefore \frac{W_1}{W_2} = \frac{I_1}{I_2} = \frac{(a_1)^2}{(a_2)^2} = \frac{16}{1}$$

[Note: Give ½ mark if the student just writes Intensity \propto width

OR

a) Obtaining the diffraction pattern	1 ½
Conditions for angular width	1 ½
b) Calculation of separation	2

The path difference (NP-LP) , between the two edges of the slit, is given by

$$NP-LP \cong NQ = a \sin\theta \approx a\theta$$

We, therefore, get maxima and minima, at different points of the screen, depending on the path difference between the contributions from the wavelets, emanating from different points of the slit. This results in a diffraction pattern on the screen.

The path difference between two points M_1, M_2 , in the slit plane, separated by a distance 'y', is $y\theta$.

At the central point, 'C', on the screen, ' θ ' is zero.

All parts of the slit contribute in phase

Hence 'C' is a maximum.

At all points where ' $\theta \cong (n + \frac{1}{2}) \frac{\lambda}{a}$ ', we get (secondary) maxima of varying intensity. This is because of the non-zero contribution of a (decreasing) part of the slit at these points.

At all points where $\theta \approx \frac{n\lambda}{a}$, we get minima.

This is because of a net (almost) zero contribution of the whole slit at these points.

[Note : Please also accept alternative correct diagram with appropriate explanation.]

(b) Angular width of the secondary maxima $\approx 2(2n+1) \frac{\lambda}{a}$

∴ Linear width = $[(2n+1) \frac{\lambda}{a}] D$

∴ Linear separation, between the first maxima (n=1) of the two wavelengths, on the screen, is

$$\frac{3(\lambda_2 - \lambda_1)}{a} \times D$$

$$\therefore \text{Separation} = \frac{3(596-590) \times 10^{-9}}{2 \times 10^{-6}} \times 1.5m$$

$$= 13.5 \times 10^{-3}m (= 13.5 \text{ mm})$$

(a) Expression for frequency	1 ½
Frequency Independent of 'v' or energy	½
(b) Sketch of cyclotron	1
Construction	1
Working	1

(a) When a particle of mass 'm' and charge 'q', moves with a velocity **V**, in a uniform magnetic field **B**, it experiences a force **F** where

$$\vec{F} = q (\vec{v} \times \vec{B})$$

½

$$\therefore \text{Centripetal force } \frac{mv^2}{r} = 2 v B_{\perp}$$

½

$$\therefore r = \frac{mv}{qB_{\perp}}$$

½

$$\therefore \text{frequency} = \frac{v}{2\pi r} = \frac{qB_{\perp}}{2\pi m}$$

∴ It is independent of the velocity or the energy of the particle.

½

1

Construction: The cyclotron is made up of two hollow semi-circular disc like metal containers, D₁ and D₂, called dees. It uses crossed electric and magnetic fields. The electric field is provided by an oscillator of adjustable frequency.

1

[**Note:** Award this mark even if the student labels the diagram properly without writing the details of the construction.]

Working: In a cyclotron, the frequency of the applied alternating field is adjusted to be equal to the frequency of revolution of the charged particles in the magnetic field. This ensures that the particles get accelerated every time they cross the space between the two dees. The radius of their path increases with increase in energy and they are finally made to leave the system via an exit slit.

1

5

OR

(a) Labelled diagram	1
Principle and working	2
(b) i) Reason for cylindrical soft iron core	1
ii) Comparison of current sensitivity and voltage sensitivity	1

1

Principle and working : A current carrying coil, placed in a uniform magnetic field, (can) experience a torque

1/2

Consider a rectangular coil for which no. of turns = N,

Area of cross- section = $l \times b = A$,

Intensity of the uniform magnetic field = B,

Current through the coil = I

∴ Deflecting torque = $BIL \times b = BIA$

For N turns $\tau = NBIA$

Restoring torque in the spring = $k\theta$

1/2

(k=restoring torque per unit twist)

$$\therefore NBIA = k\theta$$

$$\therefore I = \left(\frac{k}{NBA} \right) \theta$$

1/2

$$\therefore I \propto \theta$$

The deflection of the coil, is, therefore, proportional to the current flowing through it.

1/2

(b) (i) The soft iron core not only makes the field radial but also increases the strength of the magnetic field.

1

[**Note**:- Award this one mark even if the student writes just one of the two reasons given above)

(ii) We have

$$\text{Current sensitivity} = \frac{\theta}{I} = NBA/k$$

$$\text{Voltage sensitivity} = \frac{\theta}{V} = \frac{\theta}{IR} = \left(\frac{NBA}{k} \right) \cdot \frac{1}{R}$$

1/2

1/2

It follows that an increase in current sensitivity may not necessarily increase the voltage sensitivity.

5

30.

Diagram	2
Principle and working	2
Use and limitation	1/2 + 1/2

2

[Note : Award 1 mark only if the diagram is not labelled]

Principle & working

Consider a set up of the type shown here

- i. Potential inside and on the surface, of the conducting sphere of radius 'R':

$$V'_R = \frac{1}{4\pi\epsilon_0} \cdot \frac{Q}{R}$$

- ii. Potential due to small sphere of radius 'r' carrying a charge 'q':

At the surface of the smaller sphere : $V'_r = \frac{1}{4\pi\epsilon_0} \cdot \frac{q}{r}$

1/2

At the surface of the larger sphere : $V_R'' = \frac{1}{4\pi\epsilon_0} \cdot \frac{Q}{R}$

∴ The difference of potential between the smaller and the larger sphere:

$$= \Delta V = \frac{1}{4\pi\epsilon_0} \cdot \left[\left(\frac{Q}{R} + \frac{q}{r} \right) - \left(\frac{Q}{R} + \frac{q}{r} \right) \right]$$

$$= \frac{q}{4\pi\epsilon_0} \left(\frac{1}{r} - \frac{1}{R} \right)$$

When 'q' is positive, the inner sphere would always be at a higher potential with respect to outer sphere, irrespective of the amount of charges on the two.

∴ When both the spheres are connected, charge will flow from the smaller sphere to the larger sphere. Thus for a set up of the type shown, charge would keep on piling up on the larger sphere.

Use : This machine is used to accelerate charged particles (electron, protons, ions) to high energies.

Limitation: It can build up potentials upto a few million volts only.

OR

(a)	Deducing the expression for torque	2
(b)	Finding the ratio of the flux through the two spheres	2
(c)	Finding the change in flux	1

(a)

The forces, acting on the two charges of the dipole, are

$$+q\vec{E} \text{ and } -q\vec{E}$$

The net force on the dipole is zero.

The two forces are, however, equivalent to a torque having a magnitude

$$\begin{aligned} \tau &= (qE)AC \\ &= qE \cdot 2a \sin \theta \\ &= pE \sin \theta \end{aligned}$$

	<p>The direction of this torque is that of the cross product $(\vec{p} \times \vec{E})$. Hence, the torque acting on the dipole, is given by</p> $\vec{\tau} = \vec{p} \times \vec{E}$ <p>(b) As per Gauss's Theorem</p> <p>Electric Flux = $\oint_S \vec{E} \cdot \vec{dS} = \frac{q_{\text{enclosed}}}{\epsilon_0}$</p> <p>∴ For sphere S₁, flux enclosed = $\phi_1 = \frac{2Q}{\epsilon_0}$</p> <p>For sphere S₂, flux enclosed = $\phi_2 = \frac{2Q+4Q}{\epsilon_0} = \frac{6Q}{\epsilon_0}$</p> <p>∴ $\frac{\phi_1}{\phi_2} = \frac{1}{3}$</p> <p>When a medium of dielectric constant ϵ_r is introduced in sphere S₁ the flux through S₁ would be $\phi'_1 = \frac{2Q}{\epsilon_r}$</p> <p>[Also award this mark if the student writes $\phi_1 = \frac{2Q}{\epsilon_0 \epsilon_r}$]</p> <p>[Note : If the student just writes that the flux through S₁ decreases, award ½ mark only.]</p>	<p>½</p> <p>½</p> <p>½</p> <p>½</p> <p>1</p>	<p>5</p>
